Seed Coating, Encrusting and Pelleting

How can we start with seed coatings?

Many seed companies are struggling to do in-house seed coating efficiently however several of them fail to do so. If it is decided to continue, how should we proceed further? Where can we get advice and technical support. How can we ensure better quality at an affordable cost?

How can we decide that what product treatment (coating, encrusting and pelleting) would bring us and our farmers the greatest advantage?

The investment is one part of the equation however the choice between system, products, procedures and technologies are extremely important that could be achieved through ISA course.

Do we have to develop your own formulation?

Once the seeds are coated, what are the critical parameters in Drying and Storage of Coated Seeds? What can be the cause of poor quality and how is it avoided.

How can we get training and support for coating our seeds?

This is what we propose and to review and answer with you during the Seed Coating, Encrusting and Pelleting Course that includes practical demonstrations on various machines with hands on training under the supervision of international experts.
